This symposia aims to produce a highly scientific program covering the principal aspects in epidemiology, genetics and pathophysiology and management of MS: early diagnosis and treatment, criteria of treatment failure, criteria for changing DMDs, long term treatment and new therapies for MS.

- Review epidemiology, genetics and pathophysiology of MS
- Review current diagnostic criteria for MS
- Identify High Risk CIS and MS early treatment
- Identify treatment failure and concepts of treatment optimization
- Identify new treatment for MS (monoclonal antibodies and oral therapies).

This program is appropriate for neurologists interested in Multiple Sclerosis.
